Executive Summary

This document provides a comprehensive overview of the trained machine learning model for heart disease risk prediction. The model is optimized prioritizing Recall and ROC-AUC to minimize false negatives in clinical settings.

Model Performance Metrics

Metric	Value
Accuracy	0.8793
Precision	0.8378
Recall (Sensitivity)	0.9688
F1 Score	0.8986
ROC-AUC Score	0.9339

Note: In healthcare applications, a high Recall is critical as it indicates the model's ability to identify all true positive cases.

Recommendations

Based on the feature importance analysis, clinicians should closely monitor the top contributing factors when assessing patient risk.
